

Geosynthetics

Engineered Solutions

SERVICES AVAILABLE

- TECHNICAL RECOMMENDATIONS As a business we offer full engineering support and preliminary calculations.
- 99% ON TIME DELIVERY
 Our dedicated transport team endeavours to provide efficient delivery every time.
- ON SITE SUPPORT We employ industry specialists to provide on

site support throughout any project.

Rhyno GW8161 Blast Wrap

When carrying out the Demolition of Tower Blocks and other concrete structures by the controlled use of Explosives one of the most important aspects of the design criteria is the containment of explosively driven fly of concrete caused by the explosion.

After trialling numerous products and materials we found that the construction and properties of Geosynthetics Rhyno GW8161 was ideal to use as part of the protective measures required to carry out a safe demolition.

Since discovering the Geotextile and through various testing of its containment qualities we have used it successfully either on its own or combined with other protection materials on numerous high profile Demolition projects including city centre tower blocks, bridges and industrial buildings.

Rhyno GW8161's Strength, durability and Puncture resistance, combined with its useful roll size it makes an ideal product for us to incorporate in our projects. Explosive demolition has advanced considerably over the last decade and it is through the use and development of products like this that has allowed this to happen.
